Launching the first Clinical Trial using CRISPR Technology

- First human clinical trial in the U.S. involving the gene-editing tool CRISPR (CAR T): **Phase 1 Trial of Autologous T Cells engineered with CRISPR Technology.**
- The study will enroll up to 18 patients fighting three different types of cancer: **multiple myeloma, sarcoma, and melanoma.**
- To help enhance the treatment, **two genes will be CRISPR deleted in patients' T cells** to make them better cancer fighters: PD-1 and TCR (danger sensing receptor). An engineered receptor, added in its place (NY-ESO-1 TCR), will instead steer them toward particular tumors.

6. Bringing tools together with Big Data: Deep Learning Tools

This past decade will be considered The Dawn of Immunotherapy:

Check point blockade & CAR-T

Check point blockade: PD1 or PDL1 Inhibitors

CAR-T therapy takes off

Chimeric Antigen Receptor

- Remissions in 83% of children with previously untreatable acute lymphoblastic leukemia .
- CAR T cells, though, don't work well against solid tumors.

Novel Avenues of Immune Oncology: NK Cells and Macrophages

Rachidi et.al., 2017.

- Natural killer cells equipped with the same type of cancer-homing receptor as CAR T cells make debut in clinical trials for Leukemia (Kati Rezvani, MD Anderson) and glioblastoma.
- CAR natural killer (CAR NK) cells may be safer, faster to produce, and cheaper, and may work in situations where T cells falter.
- CAR macrophages on the horizon of clinical trials (Gill and Klichinsky)

The Human and Financial Economics of Cancer

(7/10)

American Association for Cancer Research (AACR)
Cancer Progress Report 2018

- The costs of cancer care alone stand in stark contrast to the amount of money the federal government invests across all areas of biomedical research.
- In 2015, the same year that the direct medical costs of cancer care were \$80.2B, the NCI budget was just \$4.93B and total NIH Budget was ~\$34B.

FIGURE 1

MAKING PROGRESS AGAINST CANCER

The age-adjusted overall U.S. cancer death rates for adults (—●—), and children and adolescents (ages 0 to 19) (-■-) have been declining steadily since the early 1990s. In 1990, there were 214.95 cancer deaths per 100,000 U.S. adults. By 2015, the most recent year for which these data are available, this had dropped to 158.68 per 100,000, a decline of 26 percent. During this period, the number of deaths from childhood cancer dropped from 3.4 per 100,000 U.S. children and adolescents to 2.3 per 100,000, a drop of 32 percent (3).

American Association for Cancer Research (AACR) Cancer Progress Report 2018

- The age-adjusted overall US cancer death rate has been decreasing since the 1990s, translating into almost **2.4 million cancer deaths avoided** between 1990-2015.
- Not all segments of the U.S. population have benefited equally from advances against cancer.
